SIGMASCOPE® SMP10
Electrical conductivity measurement of non-ferrous metals enters a new dimension
The electrical conductivity is an important material property that not only informs about how well a metal conducts electrical current but also provides information about its composition, microstructure or mechanical properties. The SIGMASCOPE® SMP10 provides excellent features for measuring these characteristics. Signal evaluation based on established physical knowledge, the latest instrument technology and software for simple handling provide the ideal basis for such measurements.

**Measurement principle**
The SIGMASCOPE® SMP10 measures the electrical conductivity using the eddy current method according to DIN EN 2004-1 and ASTM E 1004. The phase-sensitive measurement signal evaluation enables a contact-free determination of the electrical conductivity, for example, under paint or synthetic coatings of up to 500 μm in thickness. This also minimizes the influence of surface roughness.

**Applications**
- Measurement of the electrical conductivity of all non-magnetic metals, even stainless steel, EURO coins, etc.
- Additional characteristics can indirectly be determined by measuring the conductivity. However, this requires preliminary investigations. Examples:
  - Measurement of the hardness and strength of heat-treated materials, e.g., aluminum alloys; inspection for heat damage.
  - Measurement of the phosphor content in copper.
  - Monitoring of deposition processes, e.g., for Cu-Cr-alloys.
  - Determination of the degree of purity.
  - Verifying the homogeneity of alloys.
  - Scrap metal sorting.

**Hardware**
The SIGMASCOPE® SMP10 is a compact, ergonomic portable instrument with a shock-resistant synthetic housing. The corresponding measurement probe ES40 is suitable for all four measurement frequencies of 60 kHz to 480 kHz. For automatic temperature compensation of the conductivity measurement (referenced to 20°C), the surrounding temperature or the current temperature of the specimen can be measured using either the temperature sensor integrated in the probe or an optional external sensor.

**Calibration standards**
A high-precision measurement is required to determine the electrical conductivity. Accurate standards are required to calibrate the instrument because the measurement is a comparison using the eddy current method. These standards are available in certified versions for the entire conductivity range. Special standards are also available for testing EURO coins, for example.
Features

• Standard measurement according to ASTM E 1004 and DIN EN 2004-1.
• Menu-driven operator guidance.
• 100 application memories for calibrations and 20,000 measurement data in up to 4,000 measurement data blocks.
• Individual consideration of the temperature coefficient as applicable to each material for the electrical conductivity.
• Measurement capture: automatic, continuous or with external start.
• Fast analog display.
• 3-stage measurement resolution.
• Graphical presentation of the specification limits on the display.
• Extensive statistical evaluation of test series with date and time as well as computation of $C_p$, $C_{pk}$ and histogram display.
• 2 display modes: scientific or statistic.
• Current saver function with adjustable measurement time.
• Automatic shut-off function.
• Manual temperature input.
• Monitoring of the temperature change over time ($\Delta T/\Delta t$).
• Alarm function for the absolute temperature deviation.
• Single display mode.
• Master calibration using 8 standards.
• Corrective calibration using a maximum of 4 standards.
• Acoustic signal for measurement capture and violation of specification limits.
• 5 display languages (D, GB, F, I, E).

Technical Data

• Ergonomically shaped robust housing; user-friendly keyboard.
• Large backlit LCD display for measurement data, measurement parameter and graphics.
• Measurement frequencies of 60 kHz, 120 kHz, 240 kHz and 480 kHz without changing probe.
• Measurement range: 0.5 - 65 MS/m, or 1 - 112 %IACS.
• Measurement accuracy at room temperature: $\pm 0.5 \%$ from MV.
• Up to 16 measurements per sec.
• Lift-off-compensation up to 0.5 mm.
• Smallest diameter of the measurement area without noticeable influence on the measurement: 13 mm

• Probe-integrated or optional external temperature sensor for the temperature compensation of the electrical conductivity measurement.
• RS232 interface for data output to printer or PC.
• Easily replaceable NiCd battery for a min. of 20 h of operating time.
• Operating temperature: 0°C to 50°C.
• Mass incl. battery: 600 g / 21 oz.
• Dimensions: L x W x H 230 x 95 x (40-55) mm / 9.1" x 3.7" x (1.6"-2.2").

Based on the user-friendly software menus, the user can quickly and easily select the instrument settings required for the measurement application, perform evaluations and present the measurement results in the desired manner. Not only in a numeric format but also in a graphical format with inserted specification limits or as a histogram.

In the standard measurement mode, the display shows the number of measurements $n$ and the electrical conductivity valid at the current temperature in addition to the electrical conductivity compensated to 20°C incl. the unit of measurement and the measurement frequency. In the statistics display mode, the display also provides information about the running mean value and the standard deviation.

In the scientific display mode, the temperature taken by the sensor as well as the temperature coefficient used for the temperature compensation of the electrical conductivity are displayed in place of the mean value and the standard deviation. Additional instrument functions can be selected by using the softkeys in the lower LCD region.

The simple display mode is available for applications where only the current display of the electrical conductivity and the number of performed measurements is of interest. The temperature compensation of the conductivity can be activated in this mode of operation as well.
